ENABLE Passwords!
and say 'goodbye hackers'

IF YOU THINK YOU DON'T NEED WINDOWS XP AND OS X PASSWORDS, THINK AGAIN.

For Windows XP, enable a strong (6 to 8 character, alphanumeric) password for all users.

In OS X, enable a strong (6 to 8 character, alphanumeric) root password. Without strong passwords, anyone can log on to your computer using the network.

**Don’t use words that are found in a dictionary!**

If you don’t create passwords for all usernames on your computer, anyone can access your computer’s files with a few simple tools.

Without passwords for all usernames, you can lose everything on your computer when you may need it most.

For simple directions on creating a SECURE password, visit security.it.emory.edu
